

Appendix 1

OID: Z39.50 Object Identifiers

(Normative)

OID.1 Object Identifier Assigned to This Standard

ANSI has assigned the following object identifier to this standard, ANSI-standard-Z39.50:

{iso (1) member-body (2) US (840) ANSI-standard-Z39.50 (10003)}

Note: This OID was originally assigned to Z39.50-1992; it applies also to Z39.50-1995.

OID.2 Object Classes Assigned by This Standard

This standard assigns the following values for object classes, at the level immediately subordinate to ANSI-standard-Z39.50:

- 1 = application context definitions
- 2 = abstract syntax definition for APDUs
- 3 = attribute set definitions
- 4 = diagnostic definitions
- 5 = record syntax definitions
- 6 = transfer syntax definitions
- 7 = resource report format definitions
- 8 = access control format definitions
- 9 = extended services definitions
- 10 = user information format definitions
- 11 = element specification format definitions
- 12 = variant set definitions
- 13 = database schema definitions
- 14 = tag set definitions

The following ASN.1 module establishes shorthand notation for the Z39.50 object identifier, and for the object classes. The notation is used in appendices that follow.

```
ANSI-Z39-50-ObjectIdentifier DEFINITIONS ::=
BEGIN
Z39-50 OBJECT IDENTIFIER ::=
{ iso (1) member-body (2) US (840) ANSI-standard-Z39.50 (10003)}
```

```
Z39-50-context          OBJECT IDENTIFIER ::= {Z39-50 1}    -- See Appendix CTX.
Z39-50-APDU            OBJECT IDENTIFIER ::= {Z39-50 2}    -- See OID.3.1.
Z39-50-attributeSet    OBJECT IDENTIFIER ::= {Z39-50 3}    -- See Appendix ATR.
Z39-50-diagnostic      OBJECT IDENTIFIER ::= {Z39-50 4}    -- See Appendix ERR.
Z39-50-recordSyntax    OBJECT IDENTIFIER ::= {Z39-50 5}    -- See Appendix REC.
Z39-50-transferSyntax  OBJECT IDENTIFIER ::= {Z39-50 6}    -- See note below.
Z39-50-resourceReport  OBJECT IDENTIFIER ::= {Z39-50 7}    -- See Appendix RSC.
Z39-50-accessControl   OBJECT IDENTIFIER ::= {Z39-50 8}    -- See Appendix ACC.
Z39-50-extendedService OBJECT IDENTIFIER ::= {Z39-50 9}    -- See Appendix EXT.
Z39-50-userInfoFormat  OBJECT IDENTIFIER ::= {Z39-50 10}   -- See Appendix USR.
Z39-50-elementSpec     OBJECT IDENTIFIER ::= {Z39-50 11}   -- See Appendix ESP.
Z39-50-variantSet      OBJECT IDENTIFIER ::= {Z39-50 12}   -- See Appendix VAR.
Z39-50-schema          OBJECT IDENTIFIER ::= {Z39-50 13}   -- See Appendix TAG.
Z39-50-tagSet          OBJECT IDENTIFIER ::= {Z39-50 14}   -- See Appendix TAG.
END
```

No object identifier is assigned by this standard for any transfer syntax. For the purpose of presentation context negotiation for an abstract syntax (including the abstract syntax for the APDUs, defined in 4.1), the abstract syntax is paired with a transfer syntax. This pairing is represented by a pair of object identifiers, one for the abstract-syntax (e.g. Z39.50-APDU) and one for the encoding rules. For abstract syntaxes described using ASN.1 (e.g. Z39.50-APDU), a set of basic encoding rules are specified by "ASN.1 Basic Encoding Rules," ISO 8825, identified by the following object identifier:

{ **joint-iso-ccitt asn1 (1) basic-encoding (1)** }

OID.3 Object Identifiers Assigned by This Standard

All object identifiers assigned by this standard (with the exception of the OID for Z39.50 APDUs, assigned in OID.3.1) are explicitly assigned in the appendices that follow.

OID.3.1 Object Identifiers for Z39.50 APDUs

This standard assigns the following object identifier for the ASN.1 definition of APDUs in 4.1.

Z39-50-APDU {**Z39-50-APDU 1**}

Note: the same OID is used for APDUs both for Z39.50-1992 and Z39.50-1995, because of the interworking capability between the two versions.

OID.4 Object Identifiers Used by This Standard

Z39.50 object identifiers are either public or locally defined. Public Z39.50 object identifiers are officially registered, by this standard or by the Z39.50 maintenance agency (see OID.5). Locally defined

Z39.50 object identifiers are registered by a registered Z39.50 implementor (see OID.6 and OID.7).

OID.5 Object Identifiers Assigned by the Z39.50 Maintenance Agency

Additional object identifiers (official Z39.50 object identifiers not registered by this standard) may be assigned by the Z39.50 Maintenance Agency (see note), of the form: {Z39-50 n m} where {z39-50 n} is an object class defined in OID.2, or is an additional object class defined by the maintenance agency.

Note: At the time of approval of this standard, the Z39.50 Maintenance Agency is the Library of Congress.

OID.6 Locally Registered Objects

Locally registered objects are of the form:

{Z39-50 n 1000 p m}

where {z39-50 n} is as described in OID.5, and 'p' is the OID index of a registered Z39.50 Implementor (contact the Z39.50 Maintenance Agency for procedures for registration of an implementor). A locally registered object may be published or private. Local, published objects are those whose definitions are coordinated with and published by the Z39.50 Maintenance Agency. Local, private objects are those whose definitions are not published by the Z39.50 Maintenance Agency.

OID.7 Experimental Objects

Experimental objects are of the form:

{Z39-50 n 2000 p m}

where {z39-50 n} is as described in OID.5, and 'p' is the OID index of a registered Z39.50 Implementor.

Appendix 2:**CTX: Application Context basic-Z39.50-ac****(Normative)**

This standard defines and registers the application context basic-Z39.50-ac. The object identifier for application context basic-Z39.50-ac is:

{ Z39-50-context 1 }

Definition of application context basic-Z39.50-ac

ANSI-standard-Z39.50 application context basic-Z39.50-ac supports an application-entity that contains only the following two application service elements (ASEs):

- a) the association control service element (ACSE, ISO 8650), and
- b) the Z39.50 service element.

Z39.50 and ACSE are used according to the procedures in section 4.2.1.

The presentation services required are those contained in the presentation kernel functional unit and the session duplex functional unit. All Information Retrieval protocol data units will be mapped onto the P-Data service.

In the event of protocol errors, the system detecting the error shall abort the association.

Only the origin may invoke the A-RELEASE service (to initiate orderly release of an A-association).

Appendix 3

ATR: Attribute Sets

(Normative)

This standard registers the attribute sets listed below, and assigns the following object identifiers:

Bib-1	{Z39-50-attributeSet 1}	(See ATR.1)
Exp-1	{Z39-50-attributeSet 2}	(See ATR.2)
Ext-1	{Z39-50-attributeSet 3}	(See ATR.3)
CCL-1	{Z39-50-attributeSet 4}	
GILS	{Z39-50-attributeSet 5}	
STAS	{Z39-50-attributeSet 6}	

Each attribute set defines a set of types and for each type a set of values. An attribute list (see AttributeList in the ASN.1 for APDUs, 4.1), constructed from an attribute set definition, is a list of attribute pairs. An attribute pair (AttributeElement in the ASN.1 for APDUs) consists of an attribute type and a value list (attributeValue within AttributeElement), where each value in the list is defined for that type.

When version 2 is in force, each value list is a single value and is an integer. When version 3 is in force, attributeValue (within AttributeElement) may select 'complex', allowing the value list to include

multiple values (each may be integer or string) and also to specify a 'semanticAction', indicating how the target is to treat the multiple attributes.

When an attribute list contains any attribute pair where attributeValue selects 'complex', there must not be any attribute type within the attribute list for which there is more than a single attribute pair.

ATR.1 Attribute Set bib-1

This section defines the attribute set bib-1.

ATR.1.1 Bib-1 Types and Values

This section lists the attribute types and values for attribute-set bib-1 (see Tables A-3-1 through A-3-6).

<u>Attribute Type</u>	<u>Value</u>	<u>Attribute Type</u>	<u>Value</u>
Use	1	Structure	4
Relation	2	Truncation	5
Position	3	Completeness	6

Table A-3-1: Bib-1 Use Attributes

<u>Use</u>	<u>Value</u>	<u>Use</u>	<u>Value</u>	<u>Use</u>	<u>Value</u>

<u>Completeness</u>	<u>Value</u>	<u>Completeness</u>	<u>Value</u>	<u>Completeness</u>	<u>Value</u>
incomplete subfield	1	complete subfield	2	complete field	3

ATR.1.2 Bib-1 Attribute Combinations

If a target does not support a given attribute list, it should fail the search and supply an appropriate diagnostic.

A given attribute type may appear zero times, one time, or more than one time, in an attribute list.

- If an attribute type does not occur in an attribute list, then (in the absence of any prior understanding, either outside of the standard or via the Explain facility) the origin should not expect any particular default target behavior.
- If an attribute type occurs exactly once in an attribute list, then the attribute value specifies the preferred target behavior with respect to that attribute type.
- It is recommended that an attribute type not occur more than once in an attribute list, unless an associated "semantic action" is included (i.e. attributeValue selects 'complex').

When attributeValue selects 'complex', 'semanticAction' may be included. SemanticAction is a sequence of integers; for bib-1, it is either a single integer or a sequence of two integers.

For the first integer in the sequence, values are:

- 1 May not substitute another attribute. If none in the list is supported, fail the search.
- 2 May substitute another attribute, but only if none in the list is supported.
- 3 May substitute another attribute at target discretion (even if one or more in the list is supported).

The second integer in the sequence is to be supplied if and only if there are multiple attributes in the list.

Values are:

- 1 Select the first supported attribute in the list.
- 2 Select the best attribute in the list.

ATR.2 Attribute Set exp-1

This section defines the attribute-set exp-1, for use with an Explain database. The attribute set exp-1 defines a single attribute type, 'Use'. In addition, this attribute set definition *imports* non-Use bib-1 attributes, i.e. those of type Relation, Position, Structure, Truncation, and Completeness (see tables A-3-2 through A-3-6). The types and values defined within the bib-1 attribute set for these attributes may be used within the exp-1 attribute set, using the object identifier for this attribute set. It is recommended that

a target supporting the Explain facility support the Relation attribute 'equal', Position attribute 'any position in field', and Structure attribute 'key'.

Note: If the target supports searching based on date ranges (e.g. to limit a search to records created before or after a particular date or between two dates), the target should also support one or more of the following relation attributes: 'less than', 'less than or equal', 'greater than', and 'greater or equal'.

Table A-3-7: Exp-1 Use Attributes

<u>Use</u>	<u>Value</u>	<u>Use</u>	<u>Value</u>	<u>Use</u>	<u>Value</u>
ExplainCategory	1	DateChanged	10	Availability	19
HumanStringLanguage	2	DateExpires	11	Proprietary	20
DatabaseName	3	ElementSetName	12	UserFee	21
TargetName	4	ProcessingContext	13	VariantSetOID	22
AttributeSetOID	5	ProcessingName	14	UnitSystem	23
RecordSyntaxOID	6	TermListName	15	Keyword	25
TagSetOID	7	SchemaOID	16	ExplainDatabase	26
ExtendedServiceOID	8	Producer	17	ProcessingOID	27
DateAdded	9	Supplier	18		

Notes:

- (1) The search terms for Use attribute ExplainCategory are listed in table A-3-8.
- (2) The search term when the Use attribute is HumanStringLanguage is the three-character language code from ANSI/NISO Z39.53-1994 -- Codes for the Representation of Languages for Information Interchange.
- (3) The search terms when the Use attribute is ProcessingContext are listed in table A-3-9.

- (4) Where the search term is an object identifier (where the name of the Use attribute ends with "OID"): for version 2, it is recommended that the term be a character string representing a sequence of integers (each represented by a character string) separated by periods. For version 3, it is recommended that the term be represented as ASN.1 type OBJECT IDENTIFIER.
- (5) Use attribute Keyword is used when searching for DatabaseInfo records (i.e. in combination with an operand where Use is ExplainCategory and term is DatabaseInfo). Its use is to search in the keyword element, for terms that match one of the query terms.
- (6) Use attribute ExplainDatabase is used when searching for DatabaseInfo records (i.e. in combination with an operand where Use is ExplainCategory and term is DatabaseInfo). The term should be NULL, for version 3, or otherwise ignored by the target. The Relation attribute either should be omitted or should be AlwaysMatches.

Table A-3-8: Search terms associated with use attribute ExplainCategory

TargetInfo	TermListInfo	SortDetails
DatabaseInfo	extendedServicesInfo	Processing
SchemaInfo	AttributeDetails	CategoryList
TagSetInfo	TermListDetails	VariantSetInfo
RecordSyntaxInfo	ElementSetDetails	UnitInfo
AttributeSetInfo	RetrievalRecordDetails	

Table A-3-9: Search terms associated with use attribute ProcessingContext

Access	Retrieval	RecordHandling
Search	RecordPresentation	

ATR.3 Attribute Set ext-1

This section defines the attribute-set ext-1, for use with an Extended Services database (see Tables A-3-10 and A-3-11). Two types are defined:

<u>Attribute Type</u>	<u>Value</u>
Use	1
Permissions	2

Additional attributes (types and/or values) may be defined within a specific Extended Service definition. The attribute set id to be used to identify those attributes is the ObjectIdentifier that identifies the specific Extended Service.

Table A-3-10: Ext-1 Use Attributes

<u>Use</u>	<u>Value</u>	<u>Use</u>	<u>Value</u>	<u>Use</u>	<u>Value</u>
UserId	1	TaskStatus	4	RetentionTime	6
PackageName	2	PackageType	5	TargetReference	7
CreationDatetime	3				

Table A-3-11: Ext-1 Permission Attributes

<u>Permission</u>	<u>Value</u>	<u>Permission</u>	<u>Value</u>	<u>Permission</u>	<u>Value</u>
Delete	1	ModifyPermissions	3	Invoke	5
Modify	2	Present	4	Any	6

Note: The Permission attribute is for use only when the value of the Use attribute is UserId, in which case the purpose is to search for task packages for which the specified user has the specified permission.

Appendix 4

ERR: Error Diagnostics

(Normative)

This standard defines and registers the diagnostic set bib-1 and the diagnostic format diag-1. The following object identifiers are assigned:

bib-1 {Z39-50-diagnostic 1} (See ERR.1)
diag-1 {Z39-50-diagnostic 2} (See ERR.2)

When version 2 is in force, a diagnostic record must conform to the following format:

```
DefaultDiagFormat ::= SEQUENCE{
    diagnosticSetId  OBJECT IDENTIFIER,
    condition        INTEGER,
    addinfo          VisibleString}
```

The diagnostic record includes an integer corresponding to a condition or error, and an (object) identifier of the diagnostic set definition that lists the condition corresponding to that integer.

When version 3 is in force, a diagnostic record may assume the form above, or alternatively, may be defined as EXTERNAL, identified by an OBJECT IDENTIFIER (which identifies the diagnostic *format*, rather than the diagnostic *set*).

Bib-1 is a diagnostic *set*. It was originally defined and registered in Z39.50-1992. This standard includes an extended definition; the conditions listed below for bib-1 include all those that were listed in the Z39.50-1992 bib-1 definition, as well as several additional diagnostics that have been added. (In particular, several of the conditions described by diag-1 that can be expressed by the above format have been added to bib-1.)

Diag-1 is a diagnostic *format*. It includes several structures for diagnostic information, each tailored to the error information being described. It also includes a single structure through which a diagnostic from a diagnostic set (e.g. bib-1) can be referenced.

Diag-1 allows several diagnostic conditions within a single diagnostic record, to describe multiple errors pertaining to the same record or operation. In particular, diagnostics from different diagnostic sets may be included within the same diag-1 diagnostic record.

ERR.1 Diagnostic Set Bib-1

Table A-4-1 below is for use when DiagnosticSetId (within DefaultDiagFormat) equals the object identifier for diagnostic set bib-1, in which case, Condition takes values from the "Code" column below.

This table may also be used by diagnostic format diag-1 when defaultDiagRec is selected for "diagnostic," and DiagnosticSetId equals the object identifier for this diagnostic set. In that case, the values of "code" and "addinfo" are taken from this table.

AddInfo is ASN.1 type VisibleString. However, for several of the diagnostics below, AddInfo is used to express the value of a parameter that has an ASN.1 type other than VisibleString. Where Addinfo is used to express a numeric value, it should be a character string representation of that value. Where Addinfo is used to express an object identifier, it should take the form of a sequence of integers (each represented by a character string) separated by periods.

Table A-4-1: Diagnostic Conditions

<u>code</u>	<u>Meaning</u>	<u>Addinfo</u>
1	permanent system error	(unspecified)
2	temporary system error	(unspecified)
3	unsupported search	(unspecified)
4	Terms only exclusion (stop) words	(unspecified)
5	Too many argument words	(unspecified)
6	Too many boolean operators	(unspecified)
7	Too many truncated words	(unspecified)
8	Too many incomplete subfields	(unspecified)
9	Truncated words too short	(unspecified)
10	Invalid format for record number (search term)	(unspecified)
11	Too many characters in search statement	(unspecified)
12	Too many records retrieved	(unspecified)

Table A-4-1: Diagnostic Conditions (continued)

<u>code</u>	<u>Meaning</u>	<u>Addinfo</u>
13	Present request out-of-range	(unspecified)
14	System error in presenting records	(unspecified)
15	Record not authorized to be sent intersystem	(unspecified)
16	Record exceeds Preferred-message-size	(unspecified)
17	Record exceeds Exceptional-record-size	(unspecified)
18	Result set not supported as a search term	(unspecified)
19	Only <i>single</i> result set as search term supported	(unspecified)
20	Only <i>AND</i> ing of a <i>single</i> result set as search term	(unspecified)
21	Result set exists and replace indicator off	(unspecified)
22	Result set naming not supported	(unspecified)
23	Specified combination of databases not supported	(unspecified)
24	Element set names not supported	(unspecified)
25	Specified element set name not valid for specified database	(unspecified)
26	Only generic form of element set name supported	(unspecified)
27	Result set no longer exists - unilaterally deleted by target	(unspecified)
28	Result set is in use	(unspecified)
29	One of the specified databases is locked	(unspecified)
30	Specified result set does not exist	(unspecified)
31	Resources exhausted - no results available	(unspecified)
32	Resources exhausted - unpredictable partial results available	(unspecified)
33	Resources exhausted - valid subset of results available	(unspecified)
100	(unspecified) error	(unspecified)
101	Access-control failure	(unspecified)
102	Challenge required, could not be issued - operation terminated	(unspecified)
103	Challenge required, could not be issued - record not included	(unspecified)
104	Challenge failed - record not included	(unspecified)
105	Terminated at origin request	(unspecified)
106	No abstract syntaxes agreed to for this record	(unspecified)
107	Query type not supported	(unspecified)
108	Malformed query	(unspecified)
109	Database unavailable	database name
110	Operator unsupported	operator
111	Too many databases specified	maximum
112	Too many result sets created	maximum
113	Unsupported attribute type	type
114	Unsupported Use attribute	value
115	Unsupported <i>term</i> value for Use attribute	term
116	Use attribute required but not supplied	(unspecified)
117	Unsupported Relation attribute	value
118	Unsupported Structure attribute	value
119	Unsupported Position attribute	value
120	Unsupported Truncation attribute	value
121	Unsupported Attribute Set	oid
122	Unsupported Completeness attribute	value
123	Unsupported attribute combination	(unspecified)
124	Unsupported coded value for term	value
125	Malformed search term	(unspecified)
126	Illegal term value for attribute	term
127	Unparsable format for un-normalized value	value
128	Illegal result set name	name
129	Proximity search of sets not supported	(unspecified)

Table A-4-1: Diagnostic Conditions (continued)

code	Meaning	Addinfo
130	Illegal result set in proximity search	result set name
131	Unsupported proximity relation	value
132	Unsupported proximity unit code	value
201	Proximity not supported with this attribute combination	attribute list
202	Unsupported distance for proximity	distance
203	Ordered flag not supported for proximity	(unspecified)
205	Only zero step size supported for Scan	(unspecified)
206	Specified step size not supported for Scan	step size
207	Cannot sort according to sequence	sequence
208	No result set name supplied on Sort	(unspecified)
209	Generic sort not supported (database-specific sort only supported)	(unspecified)
210	Database specific sort not supported	(unspecified)
211	Too many sort keys	number
212	Duplicate sort keys	key
213	Unsupported missing data action	value
214	Illegal sort relation	relation
215	Illegal case value	value
216	Illegal missing data action	value
217	Segmentation: Cannot guarantee records will fit in specified segments	(unspecified)
218	ES: Package name already in use	name
219	ES: no such package, on modify/delete	name
220	ES: quota exceeded	(unspecified)
221	ES: extended service type not supported	type
222	ES: permission denied on ES - id not authorized	(unspecified)
223	ES: permission denied on ES - cannot modify or delete	(unspecified)
224	ES: immediate execution failed	(unspecified)
225	ES: immediate execution not supported for this service	(unspecified)
226	ES: immediate execution not supported for these parameters	(unspecified)
227	No data available in requested record syntax	(unspecified)
228	Scan: malformed scan	(unspecified)
229	Term type not supported	type
230	Sort: too many input results	max
231	Sort: incompatible record formats	(unspecified)
232	Scan: term list not supported	alternative term list
233	Scan: unsupported value of position-in-response	value
234	Too many index terms processed	number of terms
235	Database does not exist	database name
236	Access to specified database denied	database name
237	Sort: illegal sort	(unspecified)
238	Record not available in requested syntax	alternative suggested syntax(es)
239	Record syntax not supported	syntax
240	Scan: Resources exhausted looking for satisfying terms	(unspecified)
241	Scan: Beginning or end of term list	(unspecified)
242	Segmentation: max-segment-size too small to segment record	smallest acceptable size
243	Present: additional-ranges parameter not supported	(unspecified)
244	Present: comp-spec parameter not supported	(unspecified)
245	Type-1 query: restriction ('resultAttr') operand not supported	(unspecified)
246	Type-1 query: 'complex' attributeValue not supported	(unspecified)
247	Type-1 query: 'attributeSet' as part of AttributeElement not supported	(unspecified)

ERR.2 Diagnostic Format Diag-1

This section defines the diagnostic format diag-1.

DiagnosticFormatDiag1

{Z39-50-diagnosticFormat diag-1 (2)} DEFINITIONS ::=

}

```

END

Appendix 5

REC: Record Syntaxes

(Normative)

This standard registers the following object identifiers for record syntaxes:

Object identifiers assigned for bibliographic syntaxes, not described via ASN.1:

Unimarc	{Z39-50-recordSyntax	1	}
Intermarc	{Z39-50-recordSyntax	2	}
CCF	{Z39-50-recordSyntax	3	}
USmarc	{Z39-50-recordSyntax	10	}
UKmarc	{Z39-50-recordSyntax	11	}
Normarc	{Z39-50-recordSyntax	12	}
Librismarc	{Z39-50-recordSyntax	13	}
Danmarc	{Z39-50-recordSyntax	14	}
Finmarc	{Z39-50-recordSyntax	15	}
MAB	{Z39-50-recordSyntax	16	}
Canmarc	{Z39-50-recordSyntax	17	}
SBN	{Z39-50-recordSyntax	18	}
Picamarc	{Z39-50-recordSyntax	19	}
Ausmarc	{Z39-50-recordSyntax	20	}
Ibermarc	{Z39-50-recordSyntax	21	}

Note: The following transfer syntax (see ISO 2709) may be used in conjunction with the above bibliographic definitions:

ISO2709 {iso standard 2709 transfer-syntax (1) character-encoding (1)}

When presentation context negotiation is used, the above syntaxes may be paired with the transfer syntax

identified by the object identifier ISO2709 for the transfer-syntax for bibliographic records defined in ISO 2709. When presentation context negotiation is not used, the above record syntaxes are assumed to be paired with ISO2709.

Object identifiers assigned for syntaxes which are described via ASN.1:

Explain	{Z39-50-recordSyntax 100}	(See REC.1)
SUTRS	{Z39-50-recordSyntax 101}	(See REC.2)
OPAC	{Z39-50-recordSyntax 102}	(See REC.3)
Summary	{Z39-50-recordSyntax 103}	(See REC.4)
GRS-1	{Z39-50-recordSyntax 105}	(See REC.5)
Extended Services	{Z39-50-recordSyntax 106}	(See REC.6)

Note: The following transfer syntax (see ISO 8825) may be used in conjunction with these definitions:

ISO8825 ::= OBJECT IDENTIFIER
{joint-iso-ccitt (2) basic-encoding (1)}

When presentation context negotiation is used, these syntaxes may be paired with the transfer syntax identified by the object identifier ISO8825 for the transfer-syntax defined in ISO 8825. When presentation context negotiation is not used, the above record syntaxes are assumed to be paired with ISO8825.

REC.1 Explain Record Syntax

RecordSyntax-explain

{Z39-50-recordSyntax explain (100)} DEFINITIONS ::=

BEGIN

IMPORTS AttributeSetId, Term, OtherInformation, DatabaseName, ElementSetName, IntUnit, Unit, StringOrNumeric, Specification, InternationalString, AttributeList, AttributeElement FROM Z39-50-APDU-1995;

Explain-Record ::= CHOICE{

-- Each of these may be used as search term when Use attribute is 'explain-category'.

targetInfo	[0]	IMPLICIT TargetInfo,
databaseInfo	[1]	IMPLICIT DatabaseInfo,
schemaInfo	[2]	IMPLICIT SchemaInfo,
tagSetInfo	[3]	IMPLICIT TagSetInfo,
recordSyntaxInfo	[4]	IMPLICIT RecordSyntaxInfo,
attributeSetInfo	[5]	IMPLICIT AttributeSetInfo,

termListInfo	[6]	IMPLICIT TermListInfo,
extendedServicesInfo	[7]	IMPLICIT ExtendedServicesInfo,
attributeDetails	[8]	IMPLICIT AttributeDetails,

elementSetDetails	[10]	IMPLICIT ElementSetDetails,
retrievalRecordDetails	[11]	IMPLICIT RetrievalRecordDetails,
sortDetails	[12]	IMPLICIT SortDetails,
processing	[13]	IMPLICIT ProcessingInformation,
variants	[14]	IMPLICIT VariantSetInfo,
units	[15]	IMPLICIT UnitInfo,
categoryList	[100]	IMPLICIT CategoryList}

-- Element set name 'B' (brief) retrieves:

- - 'commonInfo' (except for otherInfo within commonInfo)
- - key elements
- - other elements designated as 'non-key brief elements'

-- Esn 'description' retrieves brief elements as well as 'description', and specific additional descriptive elements if designated.

-- Element set name 'F' (full) retrieves all of the above, as well as those designated as "non-brief elements". Some elements designated as OPTIONAL may be mandatory in full records, and are so identified. (Note that all elements that are not part of the brief element set must be designated as OPTIONAL in the ASN.1, otherwise it would be illegal to omit them.)

-- Other esns are defined (below) as needed.

-- - - - - - Info Records

-- Info records are mainly for software consumption

-- They describe individual entities within the target system:

- The target itself
- Individual databases
- Schemas
- Tag sets
- Record syntaxes
- Attribute sets
- Term lists
- Extended services

-- The information about each Schema, Tag Set, Record Syntax and Attribute Set should match the universal definitions of these items. The only exception is that a target may omit any items it doesn't support, for example the description of the bib-1 attribute set may omit attributes that the target does not support under any circumstances.

-- Databases that may be searched together can be listed in the dbCominations element of the TargetInfo record.

```
TargetInfo ::= SEQUENCE {
  commonInfo      [0]  IMPLICIT CommonInfo OPTIONAL,

  esASN               [12] IMPLICIT InternationalString OPTIONAL -- the ASN.1 for this ES
}

-- ----- Detail records
-- The detail records describe relationships among entities supported by the target. RetrievalRecordDetails describes
-- the way that schema elements are mapped into record elements. This mapping may be different for each
-- combination of database, schema, record syntax. The per-element details describe the default mapping.
-- Origin-request re-tagging can change that mapping. When multiple databases are listed in a databaseNames
-- element, the record applies equally to all of the listed databases. This is unrelated to searching the databases
-- together. AttributeDetails describes how databases can be searched. Each supported attribute is listed, and the
-- allowable combinations can be described.

AttributeDetails ::= SEQUENCE {
  commonInfo          [0] IMPLICIT CommonInfo OPTIONAL,
  -- Key elements follow:
  databaseName        [1] IMPLICIT DatabaseName,
  -- Non-brief elements follow:
  attributesBySet     [2] IMPLICIT SEQUENCE OF AttributeSetDetails OPTIONAL,
  -- mandatory in full record
  attributeCombinations [3] IMPLICIT AttributeCombinations OPTIONAL}

-- AttributeSetDetails referenced by AttributeDetails
AttributeSetDetails ::= SEQUENCE {
  attributeSet        [0] IMPLICIT AttributeSetId,
  attributesByType    [1] IMPLICIT SEQUENCE OF AttributeTypeDetails }

```

```

AttributeTypeDetails ::= SEQUENCE {
    attributeType      [0] IMPLICIT INTEGER,
    defaultIfOmitted  [1] IMPLICIT OmittedAttributeInterpretation OPTIONAL,
    attributeValues    [2] IMPLICIT SEQUENCE OF AttributeValue OPTIONAL }
    -- If no attributeValues are supplied, all values of this type are fully
    -- supported, and the descriptions in AttributeSetInfo are adequate.

```

```

OmittedAttributeInterpretation ::= SEQUENCE {
    defaultValue      [0] StringOrNumeric OPTIONAL,
    -- A default value is listed if that's how the server works
    defaultDescription [1] IMPLICIT HumanString OPTIONAL }
    -- The human-readable description should generally be provided.
    -- It is legal for both default elements to be missing, which
    -- means that the target will allow the attribute type to be
    -- omitted, but isn't saying what it will do.

```

```

AttributeValue ::= SEQUENCE {
    value             [0] StringOrNumeric,
    description       [1] IMPLICIT HumanString OPTIONAL,
    subAttributes     [2] IMPLICIT SEQUENCE OF StringOrNumeric OPTIONAL,
    superAttributes   [3] IMPLICIT SEQUENCE OF StringOrNumeric OPTIONAL,
    partialSupport    [4] IMPLICIT NULL OPTIONAL }
    -- partialSupport indicates that an attributeValue is accepted, but may not be processed in the
    -- "expected" way. One important reason for this is composite databases: in this case partialSupport
    -- may indicate that only some of the subDbs support the attribute, and others ignore it.

```

```

TermListDetails ::= SEQUENCE{ -- one for each termList in TermListInfo
    commonInfo      [0] IMPLICIT CommonInfo OPTIONAL,

REC.2 Simple Unstructured Text Record Syntax

The Simple Unstructured Text Record Syntax (SUTRS) is intended to be used as a record syntax in a Search or Present response, to present textual data so that the origin may display them with little or no analysis and manipulation. A SUTRS record is unstructured; the text of a SUTRS record might represent individual elements, but the elements are not explicitly identified by the syntax. The convention prescribed by the SUTRS definition is to use a delimiter within the text to indicate the end of a line

of text. The prescribed line terminator is ASCII LF (X'0A'). Thus a SUTRS record consists simply of a string of textual data.

This definition recommends that the maximum line length be 72 characters unless an alternative maximum is requested, for example via a variantRequest. This is not an absolute maximum, but it is recommended that targets make a best effort to limit lines to this length.

RecordSyntax-SUTRS

```
{Z39-50-recordSyntax SUTRS (101)} DEFINITIONS ::=
BEGIN
IMPORTS InternationalString FROM Z39-50-APDU-1995;
  SutrsRecord ::= InternationalString
-- Line terminator is ASCII LF (X'0A').
-- Recommended maximum line length is 72 characters.
END
```

REC.3 OPAC Record Syntax**RecordSyntax-opac**

```
{Z39-50-recordSyntax opac (102)} DEFINITIONS ::=
```

```
BEGIN
```

```
IMPORTS InternationalString FROM Z39-50-APDU-1995;
```

```
OPACRecord ::= SEQUENCE {
```

```
